Equipment Condition Report

London Offshore Consultants, Inc Att Tom Ronning 16800 Imperial Valley Drive, Suite 280 **HOUSTON TX 77060** USA

Machine ID: Flag Gangos - Pump 1 - Port

Hydr system

Make/Type:

Application:

Cust. Order N°:

Shell Tellus T 32 Product:

Product (h/km):

Machine (h/km):

Filter (h/km):

System (I): Top-up (I):

Lab Sample N°: **GP895**

Label N°:

Equipment Ref. N°: **LGP658** Sample Taken: 29/10/2014 03/11/2014 Sample Received:

GP895 29/10/2014

Reported Maintenance:

No maintenace actions mentioned.

Comments Oil Condition:

Visual aspect: light brown coloured, turbid, with visual foreign matter.

The water content is not significant: 54 ppm.

The kinematic viscosity @40°C, 32.06 mm²/s, complies with the mentioned ISO VG32 specification limit.

The kinematic viscosity @50°C is 22.26 mm²/s

The kinematic viscosity @60°C is 16.14 mm²/s

The kinematic viscosity @70°C is 12.14 mm²/s

The kinematic viscosity @100°C is 6.1 mm²/s

The oil's acidity is considered acceptable for this application: 0.43 mgKOH/g.

The ICP spectrometry reveals 31 ppm copper, 22 ppm lead, 19 ppm tin and 12 ppm iron.

Comments Machine Condition:

The WPC is used to establish a wear baseline because the WPC remains more or less the same from sample to sample over a period of time as long as a machine is operating normally. The current WPC, 353 is difficult to diagnose without historlical data, but is too high though for a hydraulic system.

The microscopic evaluation of the ferrogram shows that the ferrous wear primordially consists of small rubbing wear platelets. <15 µm. Heat treatment reveals that 85% of the ferrous wear particles are low alloy steel.

The amount of dark oxides is notable. (index: 6).

The presence of non-magnetic wear particles is also non-negligible. They concern blank metal.

The system contamination is high (index: 7). It consists of mostly sand/dust/silt and also carbonaceous particles.

Recommendations:

Without historical data it is difficult to give adequate recommendations, but based on current analysis results we consider the overall condition cautiously as CRITICAL.

Keep under close observation.

It is recommended that this unit is checked for any unusual operating conditions. Monitor temperatures, pressures, noises, filtration, ... as applicable.

We recommend the efficiency of the system filter is checked.

A preventive oil change is advised. Check th erecommendations of the manufacturer concerning oil change.

Ensure representative sampling of the system.

Recommendations are advisory only and based on the assumption that equipment data and sample are accurate and representative of component being sampled.

Equipment Condition Report

Sample Reported: 06/11/2014 Hilde Lecluyse
